Section 1 : COD

1. Problem Statement

A linguist named Meera is classifying a list of words based on their first character. She wants to store words grouped by their starting letter using a TreeMap so that the groups appear in sorted order of characters (i.e., 'a' to 'z'). For each letter, all words starting with that letter should be stored in the order they appear.

Implement the logic inside a class named WordClassifier using the TreeMap<Character, List<String>> collection.

Input Format

The first line of the input contains an integer n, representing the number of words.

The next n lines each contain a word.

Output Format

The first line of the output prints: "Grouped Words by Starting Letter:"

The next lines print each character key and its list of words in the format:

"letter: word1 word2 word3..."

..."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5

dog

deer

cat

cow

camel

Output: Grouped Words by Starting Letter:

c: cat cow camel

d: dog deer

Answer

```
import java.util.*;
```

```
// You are using Java
```

```
class WordClassifier {
```

```
    void classifyWords(List<String> s){
```

```
        System.out.println("Grouped Words by Starting Letter:");
```

```
        TreeMap<Character,List<String>> p=new TreeMap<>();
```

```
        for(String m:s){
```

```
            char c=m.charAt(0);
```

```
            p.putIfAbsent(c,new ArrayList<>());
```

```
            p.get(c).add(m);
```

```
        }
```

```
        for(Map.Entry<Character,List<String>> l:p.entrySet()){
```

```
            System.out.print(l.getKey()+" ");
```

```

        for(String o:l.getValue()){
            System.out.print(o+" ");
        }
        System.out.println();
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine());

        List<String> words = new ArrayList<>();
        for (int i = 0; i < n; i++) {
            words.add(sc.nextLine());
        }

        WordClassifier classifier = new WordClassifier();
        classifier.classifyWords(words);
    }
}

```

Status : Correct

Marks : 10/10

2. Problem Statement

Bob wants to develop a score-tracking application for a gaming tournament. Each player's score is stored in a HashMap with the player's name as the key and the score as the value.

Write a program to assist Bob that takes user input to enter player scores, calculates the maximum score from the HashMap, and prints the player with the highest score.

Input Format

The input consists of strings representing player details in the format "playerName:score".

The input is terminated by entering "done".

Output Format

The output displays a string, representing the player's name who scored the maximum.

If the value is not numeric, print "Invalid input".

If any special characters other than ':' are given, print "Invalid format".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: Alice:15

Bob:56

done

Output: Bob

Answer

```
import java.util.*;
```

```
// You are using Java
```

```
class ScoreTracker {
```

```
    HashMap<String,Integer> scoreMap=new HashMap<>();
```

```
    public boolean processInput(String s){
```

```
        if(s.contains(":")){
```

```
            String[] l=s.split(":");
```

```
            String j=l[1];
```

```
            for(int i=0;i<j.length();i++){
```

```
                if(!Character.isDigit(j.charAt(i))){
```

```
                    System.out.print("Invalid input");
```

```
                    return false;
```

```
                }
```

```
                scoreMap.put(l[0],Integer.valueOf(j));
```

```
            }
```

```
        }else{
```

```
            System.out.print("Invalid format");
```

```
            return false;
```

```
        }
```

```
    }return true;
```

```

    }
    public String findTopPlayer(){
        if(scoreMap.isEmpty()){
            return " ";
        }else{
            int m=0;
            String mn="";
            for(Map.Entry<String,Integer> x:scoreMap.entrySet()){
                if(x.getValue()>m){
                    m=x.getValue();
                    mn=x.getKey();
                }
            }
            return mn;
        }
    }
}

```

```

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        ScoreTracker tracker = new ScoreTracker();
        boolean validInput = true;

        while (true) {
            String input = scanner.nextLine();

            if (input.toLowerCase().equals("done")) {
                break;
            }

            if (!tracker.processInput(input)) {
                validInput = false;
                break;
            }
        }

        if (validInput && !tracker.scoreMap.isEmpty()) {
            System.out.println(tracker.findTopPlayer());
        }

        scanner.close();
    }
}

```

}

3. Problem Statement

Arjun is working on a program that checks if one set of numbers is a subset of another. If Set B is a subset of Set A, the program should print "YES" followed by the sorted elements of Set B. If Set B is not a subset of Set A, the program should print "NO" followed by the average of all elements from both sets combined, rounded to two decimal places.

Implement a class Solution with the required method to perform the subset check using TreeSet in Java.

Input Format

The first line contains an integer n - the number of elements in Set A.

The second line contains n space-separated integers - the elements of Set A.

The third line contains an integer m - the number of elements in Set B.

The fourth line contains m space-separated integers - the elements of Set B.

Output Format

If Set B is a subset of Set A, print "YES" followed by the sorted values of Set B.

Otherwise, print "NO" followed by the average of all numbers in both sets (rounded to two decimal places).

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
1 2 3 4 5
3

2 3 5

Output: YES 2 3 5

Answer

```
import java.util.*;

// You are using Java
class Solution {
    public static void checkSubset(TreeSet<Integer> setA,TreeSet<Integer>
setB,int n,long s){
        if(setA.containsAll(setB)){
            System.out.print("YES ");
            for(int w:setB){
                System.out.print(w+" ");
            }
        }else{
            System.out.print("No ");
            double r=(double)s/n;
            System.out.printf("%.2f",r);
        }
    }
}

class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        TreeSet<Integer> setA = new TreeSet<>();
        long sum = 0;
        for (int i = 0; i < n; i++) {
            int num = sc.nextInt();
            setA.add(num);
            sum += num;
        }
        int m = sc.nextInt();
        TreeSet<Integer> setB = new TreeSet<>();
        for (int i = 0; i < m; i++) {
            int num = sc.nextInt();
            setB.add(num);
            sum += num;
        }
        Solution.checkSubset(setA, setB, n + m, sum);
    }
}
```

```
        sc.close();
    }
}
```

4. Problem Statement

David is managing an employee database where each employee has a unique ID, name, and department. He wants to ensure that duplicate employee IDs are not added to the system. Implement a Java program that allows adding employees to the system, displaying all employees, and checking if an employee exists based on the given ID.

Implement a class `EmployeeDatabase` that contains a `HashSet` to store employee records. The `Employee` class should be a user-defined object containing employee details. The main class should handle user operations and interact with the `EmployeeDatabase` class.

Input Format

The first line contains an integer `n` representing the number of employees to be added.

The next `n` lines follow, each containing:

1. An integer `employee_id`
2. A string `name`
3. A string `department`

The next line contains an integer `m` representing the number of queries.

The next `m` lines follow, each containing an employee ID to check for existence.

Output Format

The output prints a list of all employees added in the format:

"ID: <employee_id>, Name: <name>, Department: <department>"

For each query, output "Employee exists" if the ID is found, otherwise "Employee

not found".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 3

101 John IT

102 Alice HR

103 Bob Finance

2

101

104

Output: ID: 101, Name: John, Department: IT

ID: 102, Name: Alice, Department: HR

ID: 103, Name: Bob, Department: Finance

Employee exists

Employee not found

Answer

```
import java.util.*;
```

```
// You are using Java
```

```
class Employee {
```

```
    //Type your code here
```

```
    int id;
```

```
    String name;
```

```
    String department;
```

```
    Employee(int id, String name, String department){
```

```
        this.id = id;
```

```
        this.name = name;
```

```
        this.department = department;
```

```
    }
```

```
}
```

```
class EmployeeDatabase {
```

```
    //Type your code here
```

```
    HashSet<Employee> a = new HashSet<>();
```

```
    void addEmployee(int id, String name, String department){
```

```

        a.add(new Employee(id, name, department));
    }

    void displayEmployees(){
        for(Employee e: a){
            System.out.println("ID: "+e.id+", Name: "+e.name+", Department:
"+e.department);
        }
    }

    public boolean checkEmployee(int id){
        for(Employee a1: a){
            if(a1.id == id){
                return true;
            }
        }

        return false;
    }
}

class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        EmployeeDatabase db = new EmployeeDatabase();
        int n = sc.nextInt();
        for (int i = 0; i < n; i++) {
            int id = sc.nextInt();
            String name = sc.next();
            String department = sc.next();
            db.addEmployee(id, name, department);
        }
        db.displayEmployees();
        int m = sc.nextInt();
        for (int i = 0; i < m; i++) {
            int id = sc.nextInt();
            if (db.checkEmployee(id))
                System.out.println("Employee exists");
            else
                System.out.println("Employee not found");
        }
        sc.close();
    }
}

```
